

# Check List

My code works flawlessly with the 10 i/o examples provided. However, there might be some edge cases (that I missed out / didn't come to my mind) that may cause differences or errors, especially in the sorting section of the "ZReport" command. Additionally, my code is case sensitive, therefore it handles "Lamp1" and "lamp1" as different devices. Since java is a case sensitive language, I personally thought this approach would be more sensible. Thank you for your time.
